

Question: What insights do you glean from your visualizations? Reflect on what your visualizations tell us about diversity, inclusion, and bias in the art world.

Answer:

The artists represented at the Museum of Contemporary Art, based on this data, appear to have diverse backgrounds in terms of nationality, birth decade, and gender.

While most artists are American, this could be attributed to the museum's location in an American city. It also provides a glimpse into the art scenes of other countries, such as France, Britain, and Germany, where numerous artists contribute, highlighting the significance of art in these nations.

However, concerning gender, biases manifest in two ways:

1. Most artists worldwide seem to be male, suggesting either an underrepresentation of women in the art world or potentially lower interest among women in the field.

2. The data lacks representation for the modern gender identity of "non-binary," which may be perceived as insensitive to those who identify as such.

Regarding birth decades, there appears to be a predominant number of male artists from the 1910s to 1940s. This could signify an underrepresentation of contemporary artists, potentially indicating a lack of interest or representation among younger individuals in the field of Contemporary Art.

Overall the snakey diagram paints a good visual on the lives of the artists represented at the MCA at Chicago.
